Econ 3324 Spring 2005

Managerial Economics

R. Claycombe

#### First Exam

Write all answers in your blue book and show all work there. Return your exam and printout(s) in your blue book.

10 pts.

1) Crazy Richard's Corp. has 2 products, Chunky and Smooth, and must soon decide which of the 2 product lines to upgrade. The investment is each is the same but the revenues are different. Which revenue stream is better? Show all work.

|         | Year 1 | Year 2 | Year 3 |
|---------|--------|--------|--------|
| Chunky: | 100    | 100    | 100    |
| Smooth: | 90     | 100    | 110    |

Note that the discount rate is .10 and that the Chunky revenues are received at year's end while the Smooth revenues are received on a daily basis throughout the year.

### 25 pts.

2) The following table gives possible profits (received at year end) and probabilities for two years.

| Year 1 |       | Ye     | Year 2 |  |  |
|--------|-------|--------|--------|--|--|
| profit | prob. | profit | prob.  |  |  |
| 500    | .4    | 600    | .3     |  |  |
| 1000   | .6    | 1000   | .7     |  |  |

- a) Sketch a tree diagram to organize your calculations.
- b) If the discount rate is .08, find the expect present value of profit and the standard deviation of that profit.

## 20 pts.

3) If the expected present value of profit for product line A is 400 with  $\sigma$  = 20 and the expected present value of profit for product line B is 600 with  $\sigma$  = 60, discuss which product line is a more attractive choice. Employ three kinds of decision criteria.

### 20 pts

- 4) Richard has observed that when price is 2 dollars Q = 100,000 and when price is 2.25 dollars Q = 80000.
- a) Assume that these points are on the same demand curve and find a value for elasticity.
- b) Given this information and marginal cost equal to \$1, is price in the right range to maximize profit?

# 25 pts

5) Consider the demand regression given below.

# **Model Summary**

| Model | R    | R Square | Adjusted<br>R Square | Std. Error of the Estimate |
|-------|------|----------|----------------------|----------------------------|
| 1     | .698 | .487     | .358                 | 5.5968                     |

## Coefficientsa

|              | Unstandardized<br>Coefficients |            | Standardized<br>Coefficients |        |      |
|--------------|--------------------------------|------------|------------------------------|--------|------|
| Model        | В                              | Std. Error | Beta                         | t      | Sig. |
| 1 (Constant) | 7.665                          | 5.442      |                              | 1.408  | .184 |
| Price        | 724                            | .225       | .689                         | -3.211 | .007 |
| Income       | .268                           | .192       | .291                         | 1.395  | .188 |
| Advertising  | -1.086                         | 1.823      | 127                          | 596    | .562 |

a. Dependent Variable: Quantity Demanded

- a) If Price = 2, Advertising = 1 and Income = 5, find the elasticity of demand.
- b) Do the independent variables all seem to have the right signs? Which of them have statistically significant effects on  $Q_d$ ? Explain.
- c) How well does the equation explain the variation of demand?
- d) Discuss an econometric problem of your choice and say how it might affect demand estimation.

I have neither given nor received unfair aid on this test nor am I aware of anyone else who has.
